Abstracts

The global Cloud Bare Metal (CBM) market size is expected to reach \$ 54196 million by 2032, rising at a market growth of 20.2% CAGR during the forecast period (2026-2032).

Cloud Bare Metal (CBM) is a single-tenant dedicated physical server instance delivered by cloud service providers in a cloud-based manner. Users have exclusive access to all its hardware resources (such as CPU, memory, and storage), but can use it like a virtual machine, achieving minute-level delivery and automated API management through the cloud platform. It typically combines the high performance and strong isolation of physical servers with the elasticity, API management, pay-as-you-go billing, and network/storage integration capabilities of cloud platforms. It is primarily used for high-performance computing, AI training/inference, big data, databases, games, core financial systems, virtualization platforms, and compliance-sensitive workloads.

Its core advantage lies in the absence of virtualization overhead and physical isolation. Through technologies such as hardware passthrough, it eliminates the performance overhead of traditional virtualization, allowing applications to directly access the underlying hardware. This makes it outstanding in scenarios such as high-performance computing (HPC), AI training, and high-frequency trading in finance.
