Abstracts

According to our (Global Info Research) latest study, the global Cloud Cybersecurity Services market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

The limiting factors of cloud cybersecurity services mainly include the following points:

Network attacks: There are many types of network attacks in cloud computing environments, including email spoofing, malicious advertising, man-in-the-middle attacks, interface and API intrusions, etc. These attack methods can lead to data leakage, fund theft and other problems, causing serious losses to cloud service providers and users.

Data vulnerabilities: Both cloud servers and physical servers may become targets of cyberattacks, but cloud servers are more likely to be targets of data theft because there is a large amount of data stored in the cloud. Although various security protection layers have been deployed, security maintenance cannot be ignored.

Internal factors: Internal staff of cloud computing service providers or enterprises may attack data in the cloud, including data theft and retaliation. This threat cannot be underestimated, and the security system of the cloud server provider alone is far from enough.

Secure coding and access control: Cloud computing service providers should conduct secure coding checks and strict access detection, and at the same time manage personnel activities and inspections to avoid unsafe factors. Additionally, the

convenience of centralized identity should be weighed against the risk of making the storage location a target for attack.

Shared technology vulnerabilities: Cloud computing service providers share infrastructure, platforms and applications. If vulnerabilities occur in any link, the entire environment will be exposed to potential threats and vulnerabilities.
