The CNC drive module is a core electronic component used to control the operation of the motor in the CNC machine tool. It receives the command signal from the CNC system, adjusts the speed, position and torque of the motor, and realizes precise drive control of each axis of the machine tool. This module usually integrates power conversion, signal processing and closed-loop control functions. It is an important bridge between the control system and the execution motor. It is widely used in automated processing equipment such as lathes, milling machines, and grinders to ensure high-precision and high-efficiency processing.
