Abstracts

Central nervous system (CNS) disease is a broad category of conditions in which the brain does not function as it should, limiting health and the ability to function. The condition may be an inherited metabolic disorder; the result of damage from an infection, a degenerative condition, stroke, a brain tumor or other problem; or arise from unknown or multiple factors. Movement disorders such as Parkinson's disease, dystonia, and essential tremor are central nervous system conditions. What they have in common is the loss of sufficient, intact nervous system circuits that orchestrate functions as varied as memory formation (in Alzheimer's) or voluntary motion (in movement disorders).

According to our (Global Info Research) latest study, the global CNS Therapeutics market size was valued at USD 78510 million in 2022 and is forecast to a readjusted size of USD 107370 million by 2029 with a CAGR of 4.6% during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Mental health segment accounted for the largest market share in 2016. It is expected to retain its dominance over the forecast period owing to developing therapeutic options for mental diseases such as personality disorders and binge eating disorders. This segment is followed by degenerative disorders segment. There is growing awareness regarding neurodegenerative diseases owing to increase in initiatives by government and nongovernment organizations, such as Alzheimer's and Related Disorders Society of India. These organizations conduct awareness campaigns and conferences, such as Asia Pacific Conference of ADI at New Delhi and Kerala State Initiative on Dementia, which encourage the adoption of treatment for degenerative and mental disorders.
