Abstracts

According to our (Global Info Research) latest study, the global Co-current Gasifiers market size was valued at USD 806.7 million in 2023 and is forecast to a readjusted size of USD 1262.1 million by 2030 with a CAGR of 6.6% during review period.

The co-current (also known as downdraft) gasifier is the most common type of gasifier. A co-current gasifier is so designed that tar, which is produced in the pyrolysis zone, travels through the combustion zone, where it is broken down or burnt. As a result, the mixture of gases in the exit stream is relatively clean.

Growing demand for clean and more efficient energy generation technology in industries as well as household applications is expected to fuel the global gasification market growth over the next seven years. Other technologies for energy generation involve wastage of energy during combustion process. However gasification is a better way of energy generation with optimum utilization of energy. The resultant gas in the process is known as syngas or producer gas which comprises higher calorific value as compared to fossil fuels. This gas provides more energy than direct combustion of fossil fuels which is another major driver for the gasification market growth.
