Amorphous silica-alumina is a synthetic substance that is used as a catalyst or catalyst support. It can be prepared in a number of ways for example: Precipitation of hydrous alumina onto amorphous silica hydrogel. Reacting a silica sol with an alumina sol. Coprecipitation from sodium silicate / aluminium salt solution, etc. Synthesis of Amorphous silica-aluminas can be done by co-precipitation method, that preceded by neutralization to form a sol phase, followed by introducing a silica solution, and then aging to form an amorphous phase.

At present, the market size of co-precipitated amorphous silica-alumina is constantly expanding. With the increasingly stringent environmental regulations and the rapid development of new energy, new materials and other fields, the demand for efficient and environmentally friendly catalysts and adsorbents is growing, which has promoted the research and development and application of ASA materials.

In the future, the co-precipitated amorphous silica-alumina market will show the following development trends:

Technological innovation and upgrading: With the continuous advancement and innovation of preparation technology, the performance of ASA materials will be further improved, and the application field will continue to expand.

Market demand growth: With the rapid development of downstream application fields and the growth of demand, the market size of ASA materials is expected to continue to expand.

Environmental protection and sustainable development: In the future, the research and development and application of ASA materials will pay more attention to environmental protection and sustainability, and promote the development of green chemistry and circular economy.

As an important synthetic substance, co-precipitated amorphous silica-alumina has broad application prospects in catalysts, petroleum refining, environmental protection and other fields.
