Abstracts

The global CO2 Mineralization Technology market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Action is currently being taken globally to mitigate global warming. The objective of reducing CO2 emissions is not a burden for society but is a significant opportunity for evolution in various industries for the sustainable production of energy and the essential minerals, metals, and materials required for modern society. CO2 mineralization is one of the most promising methods to effectively reduce CO2 emissions via the formation of stable mineral carbonates.

CO2 mineralization technology, also known as CO2 mineral carbonation or CO2 mineral storage, is a process that involves capturing carbon dioxide (CO2) emissions and converting them into stable mineral forms. This approach aims to permanently store CO2 by transforming it into solid carbonate minerals through chemical reactions.

In CO2 mineralization, CO2 is typically captured from industrial flue gases or other sources, such as direct air capture. The captured CO2 is then reacted with a mineral-rich feedstock, commonly referred to as a feedstock or mineral reactant, which contains metal oxides like calcium or magnesium. These metal oxides react with CO2 to form solid carbonates.

This report studies the global CO2 Mineralization Technology demand, key companies, and key regions.
