Abstracts

The global Coagulants and Flocculants for Water Treatment market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Flocculation and Coagulation in water treatment are used to remove suspended solids through a process that destabilizes the suspended particles in water solutions. The difference between the two is coagulation is the coming together, or clumping of particles, and flocculation is the settling of coagulated particles. Their purpose is to remove and neutralize charge density of particles with coagulation and then facilitate particle bounding through flocculation so that the larger aggregated particles easily separate from the water and settle to the bottle.

Coagulants and flocculants are chemicals used to remove suspended solids from water and wastewater. Coagulants neutralize the static charge of the particles and make them clump together into small flocs. Flocculants enhance the floc formation and increase the floc sizes so that they can be more easily separated from the liquid phase. Coagulation and flocculation are essential parts of water treatment for reducing turbidity and organic loads.
