The coalescing oil water separator is a device used to achieve liquid-liquid separation. It is mainly used to separate the water in oil through physical methods. Its working principle is based on the different wettability of oil and water to materials. By regulating the surface properties of the coalesced material, the oil and water phases are separated. This method has the advantages of good structural controllability, high separation efficiency, and low operating cost, so it is widely used in the field of emulsified oil-water separation.
