Abstracts

The global Coating Gas Permeability Tester market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A Coating Gas Permeability Tester is a device used to measure the permeability of gases through various types of coatings and films. The device consists of a test chamber that is filled with a gas, typically oxygen or nitrogen, and a sample holder for the coating or film being tested. The sample is placed between two chambers, one containing the testing gas and the other a reference gas. The difference in pressure between the two chambers is measured over a specific period of time to determine the rate at which the gas permeates through the coating or film. This information can be used to evaluate the effectiveness of various coatings and films in preventing the permeation of gases, such as oxygen or water vapor, through packaging materials. It is commonly used in the food and beverage industry to ensure the quality and freshness of products during storage and transport.
