## Abstracts

The global Cochlear Implant Device market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A cochlear implant is an electronic device that improves hearing. This option is used for people who have severe hearing loss due to inner ear damage and cannot hear well with hearing aids. While hearing aids only amplify sound, cochlear implants bypass the damaged part of the ear and transmit sound signals to the auditory nerve. A cochlear implant has a sound processor that is placed behind the ear. The processor captures the sound signal and sends it to a receiver implanted in the skin behind the ear. The receiver sends signals to electrodes implanted in the cochlear inner ear (cochlea). These signals stimulate the auditory nerve, which then sends these signals to the brain. The brain interprets these signals as sounds, although these sounds are not identical to natural hearing sounds. Learning to interpret the signals from a cochlear implant takes some time and training. After 3 to 6 months of use, most cochlear implant recipients experience considerable improvement in understanding language.

This report studies the global Cochlear Implant Device production, demand, key manufacturers, and key regions.
