ECO is a specific rubber material, which is an elastomeric material synthesized by copolymerization of epichlorohydrin and ethylene oxide. This rubber material plays an important role in the rubber industry and is widely used in many fields due to its unique chemical structure and physical properties. The main chain of ECO contains ether bonds (—C—O—C—), and the side chain contains chloromethyl ($\text{—CH}_2\text{Cl}$). This structure gives ECO a series of excellent properties, such as cold resistance, oil resistance, weather resistance and heat resistance. ECO is widely used in many fields due to its excellent performance, such as automobile manufacturing, defense industry, petrochemical industry, etc. In these fields, ECO is often used to manufacture various key components such as seals, hoses, shaft seals, etc.
