The global Cockpit-Driving Integrated Domain Controller market size is expected to reach \$ 11133 million by 2032, rising at a market growth of 20.0% CAGR during the forecast period (2026-2032).

Cockpit-Driving Integrated Domain Controller is a software-hardware integrated in-vehicle control unit that combines smart cockpit functions and assisted-driving functions on one computing platform. It integrates automotive-grade computing chips, high-speed communication, operating environment, middleware, virtualization, human-machine interaction services, perception data processing, AI task scheduling, and safety isolation into a unified domain-controller architecture, enabling shared computing resources, shared perception data, coordinated cockpit-driving interaction, and software-defined function deployment. In 2025, production was 6.7 million units and the average price was USD 450 per unit. The industry's capacity utilization rate in 2025 was about 65%, and the average gross margin was around 28%. Upstream, the key components mainly include automotive-grade SoC chips, high-speed memory, Ethernet switch chips and PHYs, PCIe switch chips, and PMIC power management chips, with representative suppliers such as Qualcomm, Micron Technology, and Broadcom providing core computing, storage, networking, and power-management components. The midstream segment focuses on computing board design, cockpit-driving fusion architecture, hardware-software integration, AI workload scheduling, perception-data sharing, service middleware integration, virtualization, high-speed communication design, thermal management, functional safety validation, cybersecurity, system testing, and vehicle-level integration, which together determine computing-resource utilization, real-time response, cockpit-driving collaboration, software scalability, safety reliability, and cost competitiveness. Downstream, Cockpit-Driving Integrated Domain Controller is mainly used in passenger cars and commercial vehicles, helping vehicle platforms integrate

intelligent driving, cockpit interaction, connectivity, body, and gateway functions into a unified software-hardware control architecture, with representative customers including Toyota, Volkswagen, and BYD.

Cockpit-Driving Integrated Domain Controllers will be pushed by automakers trying to reduce duplicated cockpit and ADAS hardware while improving user-visible functions. In passenger cars, the value is to connect navigation, display interaction, voice, parking, driver assistance, and safety alerts through one software-hardware platform, making cockpit experience and driving assistance work more coherently. For commercial vehicles, the same architecture can support driver monitoring, fleet connectivity, assisted parking, and operational safety management. The industry focus will shift from separate domain performance to shared computing, interaction coordination, safety isolation, thermal reliability, and software reuse across vehicle models.
