## Abstracts

The global Cognitive Decline Treatment market size is expected to reach \$ 248320 million by 2032, rising at a market growth of 7.0% CAGR during the forecast period (2026-2032).

Cognitive decline treatment refers to a comprehensive medical intervention system that addresses the decline in memory, attention, executive function, and language abilities caused by aging, neurodegenerative diseases, brain injury, or metabolic diseases. It utilizes a combination of methods, including drug therapy, non-drug interventions, neuromodulation techniques, and digital therapies, to slow or improve the progression of cognitive decline. Its core objectives are to slow disease progression, improve patients' daily living abilities, and enhance their quality of life.

With the accelerating aging of the global population and the rapid increase in the number of people aged 65 and above, the incidence of cognitive decline-related diseases continues to rise, significantly expanding the demand for treatment and intervention. Simultaneously, in drug development, the entry of A $\beta$  monoclonal antibodies into clinical application marks a breakthrough in disease-modifying therapy (DMT). Coupled with the development of digital therapies, AI-based early screening tools, brain-computer interfaces, and neuromodulation technologies, cognitive decline treatment is evolving from single-drug therapy to a comprehensive solution encompassing 'drugs + devices + digital therapies + rehabilitation management.' The market is expected to continue its rapid growth in the future, extending towards early screening, delaying onset, and long-term management.
