According to our (Global Info Research) latest study, the global Coherent DSP ASIC market size was valued at US\$ 4939 million in 2025 and is forecast to a readjusted size of US\$ 10623 million by 2032 with a CAGR of 11.5% during review period.

A coherent DSP ASIC is a digital application-specific integrated circuit used in coherent optical communications. It maps high-speed electrical data into phase, amplitude, and polarization-multiplexed optical signals at the transmitter side, and performs sampling, equalization, chromatic dispersion compensation, carrier recovery, polarization demultiplexing, forward error correction, link monitoring, and data recovery at the receiver side. It is the core electronic device in coherent optical modules, coherent optical engines, and optical transport systems. These chips address signal distortion, noise accumulation, spectral efficiency, and power constraints in high-speed long-distance fiber transmission, and typically work together with silicon photonics, indium phosphide, thin-film lithium niobate modulators, coherent receivers, drivers, transimpedance amplifiers, and tunable lasers. Product forms include standalone merchant ASICs, module-embedded DSPs, DSP-optics co-packaged devices, line-card embedded coherent engines, and pluggable digital coherent optical modules.

Customers include cloud service providers, telecom operators, optical module vendors, transport equipment vendors, and high-speed router vendors. Applications extend from data center interconnect, metro transport, regional long haul, backbone networks, and submarine cables to cross-data-center AI cluster connectivity, while technology development focuses on higher baud rates, advanced CMOS process nodes, stronger FEC and PCS algorithms, lower power per bit, smaller packaging, and broader open-standard interoperability.

The value of coherent DSP ASICs is rapidly expanding from traditional long-haul transport systems into cloud data center interconnects and AI infrastructure. The key driver is the need to move larger volumes of data between AI training and inference clusters across campuses and data centers, while conventional short-reach direct-detection solutions face increasing pressure under longer reach, higher spectral efficiency, and lower error-rate requirements. Marvell's Orion targets 800G ZR/ZR+ pluggable modules, Cisco Acacia's Jannu supports 1.2T single-carrier multi-haul transmission, and NTT Innovative Devices' ExaSPEED GAIA supports 1.2T per wavelength, demonstrating that high-end coherent DSPs are becoming critical bottleneck components for cross-data-center and carrier optical transport networks.

The competitive landscape is forming around three routes: merchant chip suppliers, vertically integrated system vendors, and new AI interconnect chip entrants. At 400G, Acacia and Marvell were key forces, while at 800G, system vendors such as Ciena and Nokia are more actively competing for pluggable coherent market share. Retym is entering the AI infrastructure and cloud connectivity segment with a 5 nm programmable coherent DSP, adding a new competitive layer to the existing supply chain.

Technology upgrades are centered on CMOS process nodes, baud rate, PCS algorithms, FEC capability, silicon photonics co-packaging, and power per bit. Ciena WaveLogic 6 uses a 3 nm CMOS coherent DSP, Nokia PSE-6s integrates its DSP with CSTAR silicon photonics, and Infinera ICE7, now under Nokia after the acquisition, uses a 5 nm CMOS DSP. These developments indicate that high-end products are moving from pure chip-performance competition toward integrated competition across silicon, optical front end, packaging, and system-level control.
