## Abstracts

According to our latest research, the global Coke Dry Quenching (CDQ) Technology market size will reach USD million in 2031, growing at a CAGR of %over the analysis period.

Coke Dry Quenching (CDQ) technology is an advanced method used in the steel industry to cool hot coke from the coke oven in an environmentally friendly and energy-efficient manner. Unlike traditional wet quenching, which uses water and generates significant air pollution and waste water, CDQ employs an inert gas, typically nitrogen, to cool the hot coke in a closed system. The heat extracted from the coke is then recovered and used to generate steam, which can be utilized for electricity production or other processes within the steel plant. This technology significantly reduces emissions of dust and pollutants, improves the quality of the coke, enhances energy efficiency, and contributes to overall environmental sustainability in steel manufacturing.
