Phase change materials (PCMs) are a type of thermal storage chemical material, characterized by the ability to change the state of matter and provide latent heat at a constant temperature. Phase change materials can store heat by utilizing their own phase changes when absorbing heat, and then perform a reverse phase change when heat is needed to release the heat. Phase change materials can be divided into three categories based on their chemical composition: inorganic phase change materials, organic phase change materials, and composite phase change materials.
