Abstracts

Cold heading is also called cold forming making these terms interchangeable in this article. This is a method of making metal in planned steps into net designed parts. Cold forming begins with a slug cut from a progressive coil or a wire, then the cold heading machine uses a chain of strong hammers and dies to form a part. Cold heading can also be defined as a process that contains the applying of a force with the use of a punch to the end of a metal blank that is in a die. The force that is applied must surpass the metal's elastic limit or its yield strength in order to permit plastic flow.
