Abstracts

Cold air power spraying is a new process in thermal spraying. Cold air power spraying has particular advantages over conventional thermal spraying processes because the sprayed material does not melt during the process. Therefore, the thermal impact on the coating and substrate is low. The high kinetic energy of the particles produces a uniform and very dense coating due to the high degree of deformation during impact on the substrate. Coating thicknesses range from a few microns to a few centimeters. The physical and chemical properties of the new coatings produced in the field of repair are almost identical to those of the substrate.

According to our (Global Info Research) latest study, the global Cold Spray Coating System market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.
