## Abstracts

According to our latest research, the global Cold Tire Retreading market size will reach USD 171 million in 2031, growing at a CAGR of 1.4% over the analysis period.

Cold tire retreading is a process in which a new tread is applied to a worn tire casing without the use of heat. Instead, it relies on an adhesive bonding method to attach the new tread to the tire. The process involves cleaning and preparing the tire casing, then applying uncured rubber tread material to the surface. The tread is typically affixed using a special bonding agent or glue and is then pressed onto the casing, where it is left to cure at room temperature over a period of time.

Unlike the hot retreading process, cold retreading does not require a mold or high heat. Cold retreading is generally more cost-effective and faster than hot retreading, but it is often used for light-duty or less demanding applications, as the bond may not be as durable or long-lasting as that achieved with heat curing. Cold tire retreading is commonly used for smaller vehicle tires or tires with less intense usage.
