Abstracts

The global Cold Valve Box (CVB) market size is expected to reach $ 440 million by 2032, rising at a market growth of 8.3% CAGR during the forecast period (2026-2032).

The cold valve box is the core control and distribution hub in a large-scale cryogenic system. It is typically located between the cold source (such as a helium refrigerator) and the terminal cooling equipment (such as superconducting magnets and cryogenic pumps). Its core function is to precisely and stably distribute the cryogenic liquid or cooling capacity generated by the cold source to multiple terminal devices through integrated valves and transmission pipelines. It mainly consists of a vacuum-insulated chamber, an internal piping system, various cryogenic valves, and temperature, pressure, and liquid level monitoring and control devices. Its vacuum insulation design provides extremely high thermal protection for the internal cryogenic components, minimizing the transfer of external heat. In large-scale scientific projects such as particle accelerators and nuclear fusion devices (such as ITER and EAST), the cold valve box is a critical piece of equipment ensuring the stable operation of the device.
