Abstracts

A cold water main pipe water supply cylinder is a water container that holds hot water under extreme pressure, drains it and provides instant hot water when a hot water faucet or appliance is turned on. Since the system is fully pressurized, there is no need to vent it to the atmosphere. Cold-water storage fed cylinders are a favorite among homeowners with pressurized central heating. When equipped with an external or built-in expansion vessel, a non-vented cylinder is especially desirable, saving domestic users space in the home as hot water is delivered under pressure and does not require bulky gravity cold water supply cylinders. Conversely, cold water main pipe water supply cylinders feed directly from the cold water line, and since the water line enters at high pressure, flow and consistency from unvented cylinders tends to be more reliable.
