Abstracts

According to our (Global Info Research) latest study, the global Collagen Sutures market size was valued at US\$ 27.8 million in 2024 and is forecast to a readjusted size of USD 36 million by 2031 with a CAGR of 3.5% during review period.

Collagen sutures are absorbable surgical sutures derived from purified collagen, a natural protein found in animal connective tissues. They are typically sourced from bovine or ovine serosa (intestinal lining). Collagen sutures are known for their biocompatibility and promote natural wound healing. They are absorbed by the body through enzymatic degradation. There are two main types: plain collagen sutures, which are absorbed relatively quickly, and chromic collagen sutures, which are treated with chromic salts to slow down the absorption rate. They are used in various procedures, including general surgery, gynecology, and ophthalmology.

The collagen suture market is a well-established segment of the surgical suture industry, but it is facing increasing competition from synthetic absorbable sutures. A key trend is the development of improved collagen processing techniques to enhance suture purity, tensile strength, and consistency. Researchers are also exploring modifications to control the absorption rate of collagen sutures more precisely, tailoring them for specific surgical applications. Another trend is the use of collagen sutures in combination with other materials or therapeutic agents. For example, collagen sutures may be coated with antimicrobial substances or growth factors to promote faster healing and reduce the risk of infection. The increasing focus on patient safety and minimizing post-operative complications is also driving the demand for high-quality collagen sutures with predictable absorption profiles. Furthermore, there's growing interest in using recombinant collagen or other non-animal sources of collagen to address concerns

about animal-derived materials and potential disease transmission. While synthetic absorbable sutures offer certain advantages in terms of consistent properties and manufacturing control, collagen sutures continue to be used in specific applications where their natural biocompatibility and promotion of tissue regeneration are valued. The focus on improving collagen processing and combining it with other technologies is expected to maintain its role in the suture market.
