A combination desiccant is a mixture of chemicals that absorb moisture and humidity from the environment. It usually consists of a combination of components, such as silica gel, activated carbon, montmorillonite, and metal-based desiccants. The main function of the combined desiccant is to absorb and remove moisture in the air, so as to prevent items from being damaged or corroded or deteriorated due to moisture. They are widely used in various fields, such as food, medicine, cosmetics, textiles, electronic products, mechanical equipment, etc., to maintain their quality and prolong their life. Different types of combined desiccants have different moisture absorption capabilities and application ranges. For example, silica gel combined desiccant is suitable for environments with relative humidity below 40%, while calcium chloride combined desiccant is suitable for environments with relatively high relative humidity.
