Combination therapies for melanoma refer to the strategic use of two or more treatment modalities to enhance therapeutic effectiveness against the disease. This often includes pairing targeted therapies, such as BRAF and MEK inhibitors, to inhibit key signaling pathways, alongside immunotherapies like checkpoint inhibitors that stimulate the immune system to attack cancer cells. By employing multiple mechanisms of action, these combinations aim to improve response rates, extend progression-free survival, and reduce the risk of resistance, offering a more robust approach to managing melanoma, particularly in advanced stages.
