According to our (Global Info Research) latest study, the global Combined Worm Gear market size was valued at US\$ 410 million in 2024 and is forecast to a readjusted size of USD 618 million by 2031 with a CAGR of 6.1% during review period.

A combined worm gear is a mechanical transmission device that combines two elements, a worm wheel and a worm, to achieve power transmission and torque conversion. The worm gear transmission drives the worm wheel through the rotation of the worm. Its unique gear meshing method can achieve a higher reduction ratio and is often used to reduce speed, increase torque and achieve precise transmission. Unlike traditional single-structure worm gears, combined worm gears are usually more compact in design and can integrate multiple functional modules, such as couplings, brakes, input shafts or output flanges, making them suitable for complex industrial scenarios.
