According to our (Global Info Research) latest study, the global Combustion Catalysts market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Catalytic combustion can be defined as a chemical process that involves use of catalysts in order to improve the efficiency of overall combustion process. The idea behind using catalyst during combustion is to lower the combustion point so that the fuel burns at a lower temperature and burn at a longer rate. The combustion catalyst have improved the fuel efficiency and has reduced the engine maintenance costs.

Combustion catalysts are used for a wide array of applications including marine, automotive and boilers amongst others. The use of combustion catalyst has also reduced the harmful carbon and other volatile organic compounds emission into the environment. Combustion catalyst also improves the mechanical efficiency of the engines by promoting cleaner combustion, reducing formation of unburnt hydrocarbon, reducing clogging of engines, and thus there has also been significant reduction in maintenance cost. The Combustion catalysts are also known as emission control catalysts.

With the increasing investments for development of advanced emission systems and exhaust systems for both gasoline and diesel powered vehicles, the market for combustion catalyst is also projected to witness significant growth. Additionally, the regulations pertaining to energy conservation, and fuel efficiency are also expected to fuel the growth of combustion catalysts market during the forecast period. Use of combustion catalysts results in relatively lower deposition of soot and other unburnt hydrocarbons. Thus, these are widely being adopted across a wide range of

applications. The major challenge faced by global combustion catalysts market is the additional cost associated with the use of such catalysts. These catalysts are usually priced relatively higher and thus add to overall operational cost. Additionally, the technical know-how associated with use of combustion catalysts including know-how pertaining to right operating temperature and an accurately adjusted residual oxygen content in the exhaust gas is a major challenge associated with use of combustion catalysts. The global Combustion Catalysts Market is a fragmented market with the manufacturers focusing on the development of environment-friendly, bio based combustion catalysts. A number of green combustion catalysts are being developed and manufacturers are using this as a differentiating strategy so as to better sustain the competition in the market.
