Abstracts

The global Commercial Projector market size is expected to reach \$ 4655 million by 2032, rising at a market growth of 7.1% CAGR during the forecast period (2026-2032). Global sales of commercial projectors reached 2.91 million units in 2025, with an average price of \$963 per unit.

Commercial projectors are projection devices specifically designed for business scenarios such as offices, education, and meetings. Their main features include high brightness (suitable for bright environments), strong stability, and a rich array of interfaces. They are used to clearly display PPTs, charts, and videos, typically connecting to computers, USB drives, and other devices to meet professional and efficient presentation needs. This differs from home projectors, which focus on entertainment and smart system experiences.

The raw materials for commercial projectors are primarily based on the dual core components of the 'optical engine + light source.' The optical engine (including DMD chip, lens, prism, etc.) accounts for more than 50% of the total BOM cost. In laser commercial projectors, the light source alone accounts for 37-41%, and the DMD chip accounts for another 11-17%, totaling over 60% and becoming the absolute largest cost component. The remaining structural components, power supply, fan, interface board, etc., account for approximately 30%. Because high-brightness laser particles and 0.47" x 0.66" DMDs still rely on foreign suppliers such as Texas Instruments, Nichia, and Osram, the bargaining power for core components is weak, and raw material costs consistently account for around 90% of the total cost.
