Abstracts

According to our (Global Info Research) latest study, the global Commercial Vehicle Dry Clutch Friction Facings market size was valued at US\$ 1448 million in 2025 and is forecast to a readjusted size of US\$ 1558 million by 2032 with a CAGR of 1.1% during review period.

Commercial vehicle dry clutch friction facings are annular friction materials mounted on both sides of a clutch driven disc and operated in air rather than transmission oil. They transmit and interrupt engine torque between the flywheel, pressure plate and transmission input shaft, while supporting smooth launch, gear shifting and torsional-vibration control. Key upstream inputs include glass fibre, aramid fibre, mineral fibre, copper or steel wire, phenolic resin, synthetic rubber, graphite, friction modifiers and functional fillers. Heavy-duty or specialty products may also use copper-based, iron-based or bronze-based sintered-metal systems. Downstream applications are primarily manual transmissions, automated manual transmissions and hybrid-commercial-vehicle torque dampers used in light commercial vehicles, medium trucks, heavy-duty trucks, tractor units, buses and specialty road vehicles. Compared with passenger-car products, commercial-vehicle facings require higher torque capacity, stronger fade resistance, longer wear life and greater mechanical strength.

In 2025, global commercial vehicle dry clutch friction facings production reached approximately 550 million units, with an average global market price is \$2.5 per unit.
