A biomarker is, according to the US National Institutes of Health, “a characteristic that is objectively measured and evaluated as an indicator of normal biological processes, pathogenic processes, or pharmacologic responses to a therapeutic intervention.” Biomarkers make take the form of cellular characteristics, metabolites (e.g. sugars, lipids and hormones), molecular variations, or physical features (e.g., clinical symptoms) and are assessed accordingly, via measurement, annotation, documents, and images. Increasingly, the discovery of novel biomarkers is closely associated with the advances in molecular biology techniques that can be accessed through analysis of DNA, RNA or proteins.

We can discriminate four main types of molecular biomarkers:

- Genomic biomarkers: Based on the analysis of DNA (deoxyribonucleic acid) profiles, especially the analysis of SNPs (single nucleotide polymorphisms), i.e. identification of punctual variations in genomic DNA.
- Transcriptomic biomarkers: Base on the analysis of RNA expression profiles.
- Proteomic biomarkers: Base on the analysis of the protein profiles.
- Metabolomic biomarkers: Base on the analysis of metabolites (metabolites are the intermediates and products of metabolism).

Commercializing biomarkers is the path that a biomarker could be used in therapeutic or diagnostic. In this report mainly covers consumables, services, software of this market.
