Abstracts

The global Common Mode Filter Choke market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The principle of Common Mode Filter Choke is that the magnetic flux in the magnetic ring is superimposed on each other when flowing through the common-mode current, so that it has a considerable inductance, which suppresses the common-mode current, and when the two coils flow through the differential-mode current, the magnetic flux in the magnetic ring cancels each other and has almost no inductance, so the differential-mode current can pass through without attenuation. Therefore, the common-mode inductor can effectively suppress the common-mode interference signal in the balanced line, and has no effect on the differential mode signal transmitted normally by the line.

This report studies the global Common Mode Filter Choke production, demand, key manufacturers, and key regions.
