According to our (Global Info Research) latest study, the global Communication Magnetic Components market size was valued at US\$ 7734 million in 2025 and is forecast to a readjusted size of US\$ 12038 million by 2032 with a CAGR of 6.4% during review period.

Communication Magnetic Components refer to functional magnetic devices used in communication equipment and systems to enable signal transmission, power conversion, electromagnetic isolation, filtering, impedance matching, and electromagnetic interference (EMI) suppression. These components are typically composed of magnetic materials (such as ferrites or soft magnetic alloys) combined with windings or integrated structures. They are widely deployed in wireless communication, optical communication, telecom power systems, data communication, and network infrastructure, serving as essential building blocks for achieving high reliability, high-frequency operation, miniaturization, and low-loss performance in modern communication systems. In 2025, global communication magnetic components production reached approximately 35588 M Units. Upstream raw materials for communication magnetic components mainly include soft magnetic materials, conductive materials, insulation systems, and packaging materials. Soft ferrites such as Mn-Zn and Ni-Zn ferrites are widely used in high-frequency inductors, common-mode chokes, and LAN transformers, while metal-based soft magnetic materials, including alloy powder cores and amorphous or nanocrystalline alloys, are increasingly adopted in high-frequency and high-power-density applications. Enamelled copper wire serves as the primary winding conductor, directly affecting resistance, thermal performance, and long-term reliability, while insulation and encapsulation materials such as epoxy resins and molding compounds ensure electrical safety and mechanical stability.

Communication magnetic components are essential passive electronic components used in communication equipment and networking systems, performing critical functions such as signal coupling, electrical isolation, impedance matching, filtering, and electromagnetic interference (EMI) suppression. Typical products include RF inductors, chip inductors, common-mode chokes, Ethernet and communication transformers, PoE magnetic modules, and other signal-isolation magnetic components, which are widely deployed across communication terminals, networking equipment, telecom infrastructure, and data centers. From a demand perspective, market growth is primarily driven by the ongoing deployment of 5G and high-speed communication networks, the rapid expansion of IoT devices, continued investment in data centers, upgrades in high-speed Ethernet, and the increasing adoption of PoE technologies. As communication systems evolve toward higher frequencies, greater bandwidth, smaller form factors, and higher reliability, magnetic components face rising technical requirements in terms of material performance, design optimization, and manufacturing consistency.
