According to our (Global Info Research) latest study, the global Communication Reconnaissance Receiver market size was valued at US\$ 2607 million in 2024 and is forecast to a readjusted size of USD 3833 million by 2031 with a CAGR of 5.6% during review period.

A communication reconnaissance receiver is a receiving device specially used to detect the radiation signals of the other party's electronic equipment. The communication reconnaissance receiver is mainly composed of an antenna, a receiving device, a terminal device, a power supply and a matching electronic computer. These components work together to detect, intercept, identify and analyze the radiation signals of the enemy's electronic equipment. Communication reconnaissance receivers are widely used in the military field and are one of the important means of electronic countermeasures and intelligence reconnaissance. By detecting enemy communication signals, it is possible to determine important information such as the enemy's troop deployment, command system configuration, and number of communication network stations, providing a basis for formulating electronic countermeasure combat plans, implementing interference and guiding firepower destruction.
