Abstracts

Transformation is a process which includes direct uptake of DNA released into an environment by host cells and simultaneously integrates that DNA with host genome for recombination. Naturally, many bacteria have an ability to take up DNA from environment. The DNA provides nutrients to these natural competent cells, while recombination leads to new genetic evolution. This ability to take up external DNA is referred as natural competence. However, not all bacteria are naturally competent; thereby reduces the chances of recombinational development. Hence, by using this concept, researchers developed artificial competence, where the cells are made competent using induced methods such as electroporation or chemicals mediated methods.
