According to our (Global Info Research) latest study, the global Complement Deficiency Tests market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Complement is the group of serum glycoprotein, the part of innate immune system that enhances the ability of antibodies and macrophages to clear the damaged cells and pathogens. Complement also promotes inflammation and aids in enhancing the immune response. The complement system is activated through a cascade. Complement deficiency is a primary immunodeficiency disorder. Deficiency in any component of complement can lead to immunosuppression, infections and sepsis. Clinical indication for complement deficiency include bacterial infection, autoimmune disease or episodes of angioedema. The deficiency can be either inherited or acquired, also it can be either complete or partial. One can screen the complement deficiency using different diagnosis test such as by performing the total serum complement classic hemolytic complement test or alternative hemolytic complement test.

Rise in prevalence of chronic diseases such as kidney disease, serum sickness may be one of the factor resulting in rise of the global complement deficiency test market. Rise in the rate of common variable immunodeficiency disease, rise in recurrent microbial infection such as *Streptococcus pneumoniae*, *Neisseria meningitidis*, and *Neisseria gonorrhoea* are the key factors likely to propel the growth of the global complement deficiency test market through 2024. High cost of therapies and lack of proper reimbursement are the few of the factors that are likely to hamper the growth of the global complement deficiency market during the forecast period.
