Abstracts

The global Composite Copper Foil Current Collector Material market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Compared with traditional current collectors, composite current collectors have a significant reduction in quality, which enables lightweight power batteries and is in line with the development trend of the new energy automobile industry. And traditional current collectors are made of pure copper foil or aluminum foil, while composite current collectors use polymer materials to replace part of the metal, resulting in lower raw material costs. Therefore, composite current collectors have less demand for core metal raw materials and are less affected by metal price fluctuations than traditional current collector materials.

The composite current collector is a new type of current collector material with a sandwich structure of 'metal conductive layer-polymer material support layer-metal conductive layer'. Theoretically, composite copper foil has the advantages of high energy density, high safety and low cost compared to traditional copper foil. Among them, the polymer material support layer is currently mainly promoted in the industry by using PET and PP materials.

This report studies the global Composite Copper Foil Current Collector Material production, demand, key manufacturers, and key regions.
