## Abstracts

According to our (Global Info Research) latest study, the global Composite Current Collector Materials market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Composite current collector materials are current collectors made of multiple materials through a composite process, usually including a composite structure of a metal substrate (such as aluminum foil, copper foil) and functional layers such as conductive polymers and carbon materials. Its purpose is to improve the conductivity, corrosion resistance, mechanical strength and lightweight performance of the current collector in the battery. It is widely used in lithium batteries, electric vehicles, energy storage equipment and other fields to improve the energy density, power output and cycle life of the battery.

The emergence of composite current collector materials marks the innovation and progress of battery technology. By composite functional materials on traditional metal current collectors, the battery has achieved significant improvements in conductivity, lightness and corrosion resistance. This type of material can not only enhance the energy density and power performance of the battery, but also effectively extend the service life of the battery, meeting the needs of electric vehicles, energy storage systems and consumer electronics for high-efficiency batteries. In the context of the global new energy transformation, composite current collector materials will

undoubtedly become an important driving force for the development of battery technology.
