## Abstracts

According to our (Global Info Research) latest study, the global Composite Electrical Contact Rivets market size was valued at US\$ 488 million in 2024 and is forecast to a readjusted size of USD 715 million by 2031 with a CAGR of 5.7% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Composite electrical contact rivets are composed of two or more different materials. Structurally, they resemble traditional rivets, with a head (the contact part) and a shank (for installation and fixation). The unique aspect is that the head is made up of multiple layers of different materials. These materials can include metals, alloys, or a combination of metals and non - metals. For example, a composite contact rivet head might consist of a three - layer structure such as silver - silver - nickel - copper. The outermost silver layer serves as the contact material, taking advantage of its excellent electrical conductivity to ensure low - resistance current conduction. The silver - nickel alloy in the middle layer provides enhanced hardness and wear resistance to withstand the mechanical wear during the opening and closing of the contacts. The copper at the bottom mainly offers good mechanical support.
