According to our (Global Info Research) latest study, the global Composite Interphase Spacer market size was valued at USD 9672.1 million in 2022 and is forecast to a readjusted size of USD 13680 million by 2029 with a CAGR of 5.1% during review period.

The main concept behind the application of galloping control composite interphase spacer is to prevent the most dangerous consequence from conductor galloping, namely phase-to-phase short-circuits. Attaining this is relatively straightforward and involves providing in-span mechanical couplings between phases, thereby maintaining phase-to-phase clearances at some pre-determined, acceptable limit. Moreover, from the oscillation damping point of view, these devices provide further benefit by limiting any torsional (twisting) motion of conductors or conductor bundles. Composite interphase spacers are applied to maintain constant distance between phases of an overhead line. The most frequent situations where these find application are where a line is exposed to strong winds and snowstorms that can generate ice sleeves on conductors.

The interphase spacer is a relatively common anti-dancing device. It plays the role of interphase insulation interval and support connection in the line. It can not only be applied to single conductors, but also can be applied to split conductors. It belongs to the insulating ability and mechanical The high-strength spacer can effectively connect the wires of different phases, so that they can restrict each other, so as to achieve the purpose of anti-galling. When the compact line system vibrates (mainly caused by wind excitation, ice coating and ice loss, and short-circuit electromagnetic impact force), the spacer will be subjected to dynamic force. Reasonable and scientific configuration of

composite interphase spacers can improve the short circuit problem caused by wire gallop between phases and improve the safe and reliable operation coefficient of transmission lines. The European power grid laying and China's national grid transmission line improvement design requirements have put forward requirements for transmission line galloping control, and there is a huge market space for equipment update and improvement of interphase spacers.
