In 2025, global Composite Material for EV Battery Enclosures production reached approximately 55.1 K Tons, with an average global market price of around 6014 USD per Ton.

Composite Material for EV Battery Enclosures refers to a high-performance structural material specifically designed for the top cover, lower box, or protective structure of power battery packs in new energy vehicles. It is made of resin as the matrix and glass fiber/carbon fiber as the reinforcing material. It has the characteristics of lightweight, high strength, high modulus, flame retardancy, heat insulation, insulation and corrosion resistance, and easy molding of large-size parts. It can replace the traditional metal shell to achieve weight reduction and energy saving, while meeting the automotive-grade safety requirements such as battery pack sealing and protection, shock resistance, and suppression of thermal runaway propagation. It is a key material for achieving lightweight and safety upgrades of power battery systems.

The upstream raw materials for Composite Material for EV Battery Enclosures mainly fall into three categories: resin matrix, reinforcing fiber, and functional additives. Typical suppliers include Huntsman, Dow, BASF, Evonik, Solvay, Teijin, etc. Downstream users are mainly battery manufacturers and battery pack manufacturers, with typical users including CATL, BYD, etc.

The production capacity of a single production line for Composite Material for EV Battery Enclosures varies greatly depending on the molding process, product size and structural complexity, and the level of equipment automation. The industry gross profit margin is usually in the range of 20%-30%.
