Abstracts

According to our (Global Info Research) latest study, the global Composite Perforator Technology market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

Composite perforation technology is an advanced perforation method used in oil and gas production. It combines traditional perforation technology with high-energy gas fracturing technology to improve the production and efficiency of oil and gas wells. Composite perforation technology increases the seepage area and reduces oil flow resistance by forming multiple microcracks while perforating, thereby increasing the production of oil wells. At the same time, since the diversion channel combined with rock pores and fractures penetrates the near-well contamination zone, the permeability of the formation can be greatly improved. This technology has been widely used in oil field development at home and abroad, especially in wells with poor reservoir properties and serious contamination, as well as in pre-fracturing operations of exploration wells.
