## Abstracts

According to our (Global Info Research) latest study, the global Composting Toilet market size was valued at USD 44 million in 2023 and is forecast to a readjusted size of USD 63 million by 2030 with a CAGR of 5.4% during review period.

A composting toilet is a type of toilet that collects and breaks down human waste and creates fertilizer as a by-product. These toilets may have a water line to help flush liquids and solids waste, but in many cases they are dry toilets that take care of waste with bacteria. Users need to manually empty the toilet about once every 3 weeks to 2 months, depending on the frequency of use and the toilet tank capacity. Composting toilets are designed to hold waste in a tank where aerobic bacteria can break down the waste products and create usable fertilizer. They function similarly to a septic system in that they separate the solid and liquid waste to help facilitate the composting process. Keep in mind that the waste will need to be emptied regularly because it does not flow into a septic system or municipal waste system.
