Abstracts

The global Compression Ignition Engines market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Compression Ignition Engines work by compressing just the air or air plus residual combustion gases in the exhaust (called exhaust gas recirculation, 'EGR'). Air is drawn into the chamber during the intake stroke and compressed during the compression stroke. This increases the air temperature within the cylinder, causing the atomized diesel fuel injected into the combustion chamber to ignite.

This report studies the global Compression Ignition Engines production, demand, key manufacturers, and key regions.
