Abstracts

According to our (Global Info Research) latest study, the global Computer Recycling Service market size was valued at US\$ 17204 million in 2025 and is forecast to a readjusted size of US\$ 24205 million by 2032 with a CAGR of 5.0% during review period.

Computer recycling services are designed to handle the disposal, reuse, and recycling of electronic devices, particularly computers and their components, in an environmentally responsible manner. These services are essential for managing electronic waste (e-waste), which can contain hazardous materials and should not be disposed of in standard waste streams. Computer recycling services play a crucial role in sustainable e-waste management, protecting the environment, conserving resources, and providing economic benefits through material recovery and equipment refurbishing.

The computer recycling service industry is undergoing a core shift toward circular economy models featuring automated AI sorting, certified secure data sanitization, and prioritized device refurbishment over raw material breakdown as the dominant trend, paired with rising mandatory e-waste laws worldwide, corporate ESG reporting requirements, shortened PC replacement cycles, and growing demand for secondary refurbished computing hardware that create major opportunities for certified IT asset disposition providers to capture residual equipment value, extract high-value rare earth and precious metals from circuit boards, and launch manufacturer trade-in programs for consumer and enterprise clients; meanwhile, the sector faces persistent challenges including volatile global prices of recycled metal commodities, inconsistent cross-border e-waste regulatory standards, unregulated informal recycling operators undercutting formal service pricing, high capital costs for advanced disassembly and data destruction

equipment, evolving strict data privacy compliance rules that raise operational certification expenses, and technical barriers to full recovery of complex modern components like solid-state drives and integrated miniaturized chips.
