According to our (Global Info Research) latest study, the global Computer Vision Model market size was valued at US\$ 673 million in 2024 and is forecast to a readjusted size of USD 955 million by 2031 with a CAGR of 5.2% during review period.

A computer vision model is a software program that is trained to detect objects in images. The model learns to recognise a set of objects by training to first analyse the images of those objects. The computer vision model takes the images as input and outputs information about the objects it detects, such as the type of object and its location.

The adoption of AI and computer vision technologies across industries, including healthcare, manufacturing, automotive, retail, and more, is driving the demand for advanced computer vision models. Computer vision models enable automation of tasks that involve image and video analysis, such as object detection, image segmentation, and facial recognition. In manufacturing, computer vision models are used for quality control, defect detection, and process optimization. Computer vision models assist in medical imaging analysis, disease detection, and diagnostic decision support. The development of self-driving cars relies heavily on computer vision models for identifying objects, pedestrians, and obstacles. Computer vision powers visual search, recommendation systems, and inventory management in the retail sector.
