Abstracts

According to our (Global Info Research) latest study, the global Computerized GOTO Tracking Mount market size was valued at US\$ 192 million in 2025 and is forecast to a readjusted size of US\$ 265 million by 2032 with a CAGR of 4.7% during review period.

In 2025, global sales of computerized GOTO tracking mounts across various applications are projected to reach approximately 102,000 units, with an average price of USD 1,840 per unit and a gross profit margin of approximately 32%?40%. The average selling price (ASP) for professional-grade models (carrying over 10 kg) and those with automated guide closed-loop control is significantly higher than that of entry-level models. By aligning the main axis with the Earth's rotation axis and independently driving and compensating for declination and right ascension, computerized GOTO tracking mounts allow the telescope to rotate counter-clockwise at a constant speed along the right ascension direction during exposures, remaining stationary relative to the sky. This significantly reduces star trailing, distortion errors, and target offset in deep-sky object imaging, light curve acquisition, and high-resolution observation of planetary details. A typical setup consists of a highly stable frame structure (aluminum alloy/steel alloy), a high-precision gear transmission system (gearbox, spiral bevel gears, or coaxial planetary gears), right ascension/declination bearing assemblies, stepper/servo motors and encoders (for drive and error feedback), declination/right ascension axes and tripod support system, a controller (handheld controller or computer interface module), and a power supply system. General parameters include a load capacity of 3?30 kg, a periodic error of ?5??30? (depending on gear precision and guiding system), a maximum torque of 10?60 N?m for the declination/right ascension axis, a tracking accuracy of 1??5? RMS, and polar alignment options of manual adjustment or automatic polar alignment. Typical usage includes: one amateur deep-sky photography

system typically equipped with one computerized GOTO tracking mount (with an 80?200 mm optical tube); research/educational institutions often configure 1?3 sets per observatory; and astronomical clubs and small observatories typically have 2?8 sets. The platform is used to guide courses and public observation. Upstream, it mainly relies on high-precision steel and copper-based lubricants for gears/bearings, aluminum alloy/carbon fiber structural components, precision encoders and drive motors, controller electronics (MCU/FPGA/drive ICs), and standard tripod accessories; downstream, it focuses on amateur and professional astronomy enthusiasts, research institutions, observatory equipment manufacturers, education and science popularization centers, and DIY astronomy system integrators.

With the increasing public interest in astronomy, more and more amateur astronomers and professional astronomers have begun to use high-precision computerized GOTO tracking mounts for celestial observations. This equipment can automatically align and track celestial objects. Advances in computer technology and control systems have continuously improved the accuracy and reliability of the computerized GOTO tracking mount. The modern computerized GOTO tracking mount has a high-resolution positioning system and powerful data processing capabilities, which can achieve more accurate tracking and shooting of celestial objects, greatly simplifying the observation process and improving observation efficiency. As production costs decrease and market competition intensifies, the price of computerized GOTO tracking mounts gradually drops, making it popular among more consumer groups. Especially in the Asia-Pacific and European markets, demand has grown significantly?.
