Abstracts

According to our (Global Info Research) latest study, the global Computerized Rotation Compensation Equatorial Mount market size was valued at US$ 66.75 million in 2025 and is forecast to a readjusted size of US$ 83.14 million by 2032 with a CAGR of 3.2% during review period.

Computerized rotation compensation equatorial mount is a mount for instruments that compensates for Earth's rotation by having one rotational axis, the polar axis, parallel to the Earth's axis of rotation. The motors also connect to an onboard computer. Once you run through a simple setup procedure, the go-to drive will find and then track your celestial target. This type of mount is used for astronomical telescopes and cameras.

With the increasing public interest in astronomy, more and more amateur astronomers and professional astronomers have begun to use high-precision GOTO tracking brackets for celestial observations. This equipment can automatically align and track celestial objects. Advances in computer technology and control systems have continuously improved the accuracy and reliability of the GOTO tracking bracket. The modern GOTO bracket has a high-resolution positioning system and powerful data processing capabilities, which can achieve more accurate tracking and shooting of celestial objects, greatly simplifying the observation process and improving observation efficiency. As production costs decrease and market competition intensifies, the price of GOTO tracking brackets gradually drops, making it popular among more consumer groups. Especially in the Asia-Pacific and European markets, demand has grown significantly?.
