According to our (Global Info Research) latest study, the global Computing Power Heat Dissipation Structural Components market size was valued at US\$ 833 million in 2025 and is forecast to a readjusted size of US\$ 2964 million by 2032 with a CAGR of 20.1% during review period.

In 2024, the price of computing power heat dissipation structural components was ??\$4,049 per thousand units, with total sales reaching ?180 million units.

Computing Power Heat Dissipation Structural Components?? are core metal structural parts that provide mechanical support and thermal conduction pathways for the cooling systems of high-performance computing devices (e.g., AI servers, GPU accelerators, data center switches). These components encompass precision die-cast/CNC-machined liquid cold plate substrates, high-thermal-conductivity fin array brackets, high-pressure-resistant sealed housings, and customized cooling frames for heterogeneous computing chips. They must meet stringent requirements for high heat flux density, multi-dimensional thermal topology, and long-term corrosion resistance. Their materials (e.g., copper alloys, aluminum silicon carbide) and manufacturing processes (e.g., ultra-thin channel milling, vacuum brazing) directly determine the cooling efficiency and reliability of computing equipment, serving as the critical physical interface between heat-generating units and active cooling components (e.g., liquid cooling pumps, immersion cooling systems).
