Abstracts

The global Computing Power Leasing market size is expected to reach \$ 125037 million by 2032, rising at a market growth of 17.6% CAGR during the forecast period (2026-2032).

Computing power leasing refers to enterprises or individuals renting computing resources such as CPUs, GPUs, and FPGAs on demand through cloud services or distributed computing platforms, acquiring computing power on a 'pay-as-you-go' basis without having to build their own data centers or purchase hardware equipment. This model, based on virtualization and cloud computing technologies, pools and standardizes underlying computing resources to form elastically scalable computing services. It is widely used in AI training and inference, high-performance computing (HPC), graphics rendering, data analysis, and scientific computing scenarios, essentially falling at the intersection of cloud infrastructure as a service (IaaS) and AI infrastructure services (AI Infra).

Computing power leasing is currently in a transitional phase from 'cloud computing expansion' to 'the core layer of AI infrastructure,' with highly certain future growth. With the explosive growth in demand for large-scale model training, generative AI, autonomous driving, and life science computing, enterprises' need for high-performance GPUs (such as A100/H100 and next-generation architectures) far exceeds their self-built capabilities, making 'on-demand computing power leasing' the mainstream approach.

This report studies the global Computing Power Leasing demand, key companies, and key regions.
