## Abstracts

This report studies the Concrete Dams Construction market. The key raw materials for concrete dams are concrete itself and steel reinforcement. Design of a concrete dam depends on the purpose of the dam and the configuration of the site where it will be built. The concrete gravity dam has weight as its strength. A cross section of this dam looks like a triangle, and the wide base is about three-fourths of the height of the dam. Water in the reservoir upstream of the dam pushes horizontally against the dam, and the weight of the gravity dam pushes downward to counteract the water pressure. The concrete buttress dam also uses its weight to resist the water force. However, it is narrower and has buttresses at the base or toe of the dam on the downstream side. These buttresses may be narrow walls extending out from the face of the dam, much like the 'flying buttresses' supporting cathedral walls or a single buttress rather like a short dam may be built along the width of the toe of the dam.

### SCOPE OF THE REPORT:

Roller compacted concrete (RCC) is frequently used for the construction of mid-sized to large mass concrete applications, including dams, because of its faster placement rate, lower heat of hydration, and reduced cost compared with conventional concrete.

Roller-compacted concrete (RCC) continues to gain recognition as a competitive material for building new and rehabilitating existing dams.

The global Concrete Dams Construction market is valued at xx million USD in 2017 and is expected to reach xx million USD by the end of 2023, growing at a CAGR of xx% between 2017 and 2023.
